Application No. 10/804,028 Gerald M. Simon Page 2

IN THE CLAIMS:

Cancel claim 6 without prejudice or disclaimer.

Please amend the claims as follows:

Claim 1. (currently amended)

- 1. A combination boat and stabilizer comprising:
 - (a) a small boat having a forward end, an aft end, first and second sides connecting the forward end to the aft end, a top rail extending along the first and second sides of the boat, and a transverse axis extending between the first and second sides of the boat; and
 - (b) a boat stabilizer system which includes first and second stabilizer units, each stabilizer unit including:
 - (1) a body with a distal end and a proximal end,
 - (2) a float fixedly mounted on the distal end of the body wherein the float includes a main float portion, at least one adjustable float portion, and a strap with fastening means structured to secure the at least one adjustable float portion vertically relative to the main float portion,
 - (3) a lock unit on the body between the proximal and distal ends of the body, the lock unit including an over-center clamping means, and

- (4) a connecting joint structured to connect the proximal ends of the bodies of the first and second stabilizing units to each other; and
- (c) wherein, in use:
 - (1)the proximal ends of the bodies of the first and second stabilizer units are connected together at the connecting joint and are located inside the boat,
 - (2) the stabilizer system extends across the boat in the direction of the transverse axis of the boat and the distal ends of the bodies of the first and second stabilizer units are located outside the boat, and
 - (3) the lock units of the first and second stabilizer units releasably engage the top rail of a respective side of the boat.

Claim 2. (original)

The combination as described in claim 1, wherein:

- (a) each main float portion of the first and second stabilizer units includes:
 - (1) an upper surface having an upper profile, and
 - (2) a lower surface having a lower profile that is identical to the upper profile; and
- (b) each adjustable float portion of the at least one adjustable float portion of the first and second stabilizer units includes:
 - (1) an upper surface having a first auxiliary profile, and
 - (2) a lower surface having a second auxiliary profile that is identical to the upper

profile of the main float portion.

Claim 3. (original)

The combination as described in claim 1, wherein each strap of the first and second stabilizer

units includes an orifice for receiving the distal end of the respective body therethrough, the

orifice being spaced such that the fastening means of the strap is located above the respective

float as the strap secures the at least one adjustable float portion vertically relative to the main

float portion.

Claim 4. (original)

The combination as described in claim 1, wherein each strap of the first and second stabilizer

units includes:

(a) a first orifice for receiving the distal end of the respective body therethrough, the first

orifice being spaced such that the fastening means of the strap is located above the

respective float as the strap secures the at least one adjustable float portion

vertically above the main float portion; and

(b) a second orifice for receiving the distal end of the respective body therethrough, the

second orifice being spaced such that the fastening means of the strap is located

above the respective float as the strap secures the at least one adjustable float

portion vertically below the main float portion.

4

Application No. 10/804,028

Gerald M. Simon

Page 5

Claim 5. (original)

The combination as described in claim 1 wherein each locking mechanism includes a threaded

bore defined in a sleeve attached to the respective body and a threaded fastener threadably

received in the threaded bore.

Claim 6. (cancelled)

Claim 7. (currently amended)

A stabilizer for a small boat having a forward end, an aft end, first and second sides connecting

the forward end to the aft end, a top rail extending along the first and second sides of the boat,

and a transverse axis extending between the first and second sides of the boat, the stabilizer

comprising:

(a) a boat stabilizer system which includes first and second stabilizer units, each

stabilizer unit including:

(1) a body with a distal end and a proximal end,

(2) a float fixedly mounted on the distal end of the body wherein the float includes

a main float portion, at least one adjustable float portion, and a strap with

fastening means structured to secure the at least one adjustable float

portion vertically relative to the main float portion,

(3) a lock unit on the body between the proximal and distal ends of the body, the

5

lock unit including an over-center clamping means, and

- (4) a connecting joint structured to connect the proximal ends of the bodies of the first and second stabilizing units to each other; and
- (b) wherein, in use:
 - (1)the proximal ends of the bodies of the first and second stabilizer units are connected together at the connecting joint and are located inside the boat,
 - (2) the stabilizer system extends across the boat in the direction of the transverse axis of the boat and the distal ends of the bodies of the first and second stabilizer units are located outside the boat, and
 - (3) the lock units of the first and second stabilizer units releasably engage the top rail of a respective side of the boat.

Claim 8. (original)

The stabilizer as described in claim 7, wherein:

- (a) each main float portion of the first and second stabilizer units includes:
 - (1) an upper surface having an upper profile, and
 - (2) a lower surface having a lower profile that is identical to the upper profile; and
- (b) each adjustable float portion of the at least one adjustable float portion of the first and second stabilizer units includes:
 - (1) an upper surface having a first auxiliary profile, and

(2) a lower surface having a second auxiliary profile that is identical to the upper

profile of the main float portion.

Claim 9. (original)

The stabilizer as described in claim 7, wherein each strap of the first and second stabilizer units

includes an orifice for receiving the distal end of the respective body therethrough, the orifice

being spaced such that the fastening means of the strap is located above the respective float as the

strap secures the at least one adjustable float portion vertically relative to the main float portion.

Claim 10. (currently amended)

The stabilizer as described in claim 7, wherein each strap of the first and second stabilizer units

includes:

(a) a first orifice for receiving the distal end of the respective body therethrough, the first

orifice being spaced such that the fastening means of the strap is located above the

respective float as the strap secures the at least one adjustable float portion

vertically above the main float portion; and

(b) a second orifice for receiving the distal end of the respective body therethrough, the

second orifice being spaced such that the fastening means of the strap is located

above the respective float as the strap secures the at least one adjustable float

portion vertically below the main float portion.

7

Application No. 10/804,028 Gerald M. Simon Page 8

Claim 11. (new)

The stabilizer as described in claim 7 wherein each locking mechanism includes a threaded bore defined in a sleeve attached to the respective body and a threaded fastener threadably received in the threaded bore.
